

ENMA 282: Recommendations

Your process FMEA and root cause analysis identify a critical element of your process that has significant impact on the process output. Based on your understanding of the process and discussions with your process sponsor, recommend actions that reduce the impact of the critical element.

Also, *assuming* that the corrective actions are implemented, return to your process FMEA, recalculate risk priority numbers, and re-rank process activities using the new assumed RPNs.

Prepare a PPT slide and a Word document summarizing your recommendations, which you will include in your final project presentation and final project report.
